ABSTRACT OF THE DISCLOSURE

The present invention provides an image heating device in a simple configuration capable of reliably positioning a member to be heated and an exciting coil, and reliably preventing vibration transmission from the exciting coil to the member to be heated. The device provides an exciting unit outside a heat generating roller provided with a heat generating belt which is a heating target and that forms a positioning section at the end of the exciting unit. The device provides a shock-absorbing member between the positioning section and a bearing so that the distance between the exciting unit and heat generating roller is kept to a predetermined distance, and can thereby provide an image heating device with a simple configuration. Thus, the present invention is capable of reliably keeping the distance between an exciting coil, provided inside the exciting unit, and the heat generating belt, provided on the heat generating roller, to a predetermined value and reliably preventing vibration transmission from the exciting unit to the heat generating roller.
